RespiraDom — Healthcare Activity Analysis

Comparative analysis of the Lyon and Bordeaux agencies | Power BI training project

Objective

Compare available activity indicators, identify differences in intervention volumes and types of care, and clarify the limits of the conclusions.

Indicator	Lyon	Bordeaux	Total
Patients	120	95	215
Interventions	362	258	620

Interventions by agency

Key findings

1. Higher activity volume in Lyon

Lyon recorded 120 patients and 362 interventions, compared with 95 patients and 258 interventions in Bordeaux. The difference is 104 interventions in favour of Lyon.

2. Different care profiles

Lyon had higher counts for enteral nutrition (96) and PPC (88). Bordeaux had higher counts for aerosol therapy (67) and infusion (58).

3. Similar completion/cancellation proportions

The source analysis reports 72.1% completed and 27.9% cancelled interventions in Lyon, compared with 75.6% and 24.4% in Bordeaux.

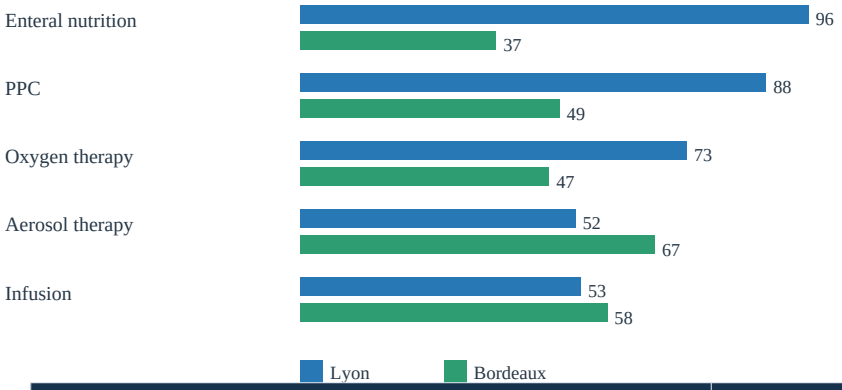
Interpretation limit

Activity volume alone does not establish which agency performs better. A stronger assessment would require additional indicators, time-based trends, and context about patients and care types.

Care Mix and Analytical Notes

The counts below reproduce the values documented in the training analysis.

Interventions by type of care



Type of care	Lyon	Bordeaux
Enteral nutrition	96	37
PPC	88	49
Oxygen therapy	73	47
Aerosol therapy	52	67
Infusion	53	58
Total interventions	**362**	**258**

What the results suggest

The agencies differ not only in overall volume but also in the mix of care types. Lyon's higher counts are concentrated in enteral nutrition and PPC, while Bordeaux records more aerosol therapy and infusion interventions.

Limitations and next steps

- Compare trends over time to determine whether the differences are stable or seasonal.
- Add relevant patient and care characteristics before interpreting differences in outcomes.
- Check the definitions of completed and cancelled interventions and the method used to calculate the percentages.

Conclusion: This exploratory analysis identifies differences in activity volume and care mix. It does not, by itself, demonstrate that one agency is more efficient or provides better care.
